DCI Boosts Research and Development in Banking Tech

- Chief Architect Fankhauser Tapped to Lead -

HUTCHINSON, KAN., March 30, 2011 – DCI, a developer of core banking software and technologies for community banks, is expanding the company's research and development department as part of a long-term initiative to expand the breadth of the company's iCore360® core banking software and other banking technologies.

Promoted to lead the department is Daren Fankhauser, vice president of research and development, who also maintains his role as chief architect for the company's iCore360° ASP.NET programming and development.

"We've always had basic R&D and a very strong, collaborative user group to provide new ideas for our product enhancements," said John H. Jones, DCI president and CEO. "Here, we are moving beyond that to scientifically go deeper into client workflows, view them alongside current and developing technologies through a wider, out-of-the-box lens, and then invent entirely new breakthroughs in how banks do business and relate to their customers. As the architect behind our iCore360° achievements for the last 15 years, Daren is the perfect choice to lead this program."

Joining Fankhauser is former DCI bank client Alan Kruse. Hired as the department vice president/industry analyst, Kruse is charged with coordinating the detailed, collaborative program of analysis into client workflows, processes and industry dynamics. Kruse is also a former DCI employee who led key research and analysis projects from 1984-2000.

Added Jones, "Alan has a great talent for analyzing workflows, and has been instrumental in helping DCI create some of our best software features, from tools that allow users to easily program their own queries and analytics interfaces, to our iCore360° executive information analysis and alternate general ledger capabilities."

About DCI

DCI is a privately-owned developer of award-winning core banking software and processing technologies for banks nationwide. DCI was founded by bankers in 1963, with several clients still serving as shareholders and board members today. DCI's flagship product, iCore360®, is a native ASP.NET web-based core processing system for complete bank management, built around a single relational source of account data, transaction integration and automation that requires only a simple PC and web browser. Other key features include imaging, internet/mobile banking, ATM/card processing, teller automation, IT management, networking and data security.
